

Notes: Pollutants should be drawn from UNCONTROLLED cells (ie values can be drawn from cells adjusted to remove double counts but should NOT be drawn from cells that adjust for controls). Controls are separately applied in the model. This means that cells linked in the NEI submission sheets and pollutant summary sheets (that account for controls) will differ from those linked here (cells prior to accounting for controls).

Be certain to also append any emissions data that is not contained in this workbook but used in the model (eg: oil and gas emissions) to the exported worksheet.
